Experiment 5: Online Flight Reservation System

AIM:

To develop a responsive Airline Reservation System web interface that consolidates flight schedules, allows seat selection and ticket generation, and provides administrative tools for inventory and flight management.

ALGORITHM:

 Start the application and display flight search options on the landing page.

 User Authentication: Enable users to register, sign in, or recover credentials via the Forgot Password page.

 Flight Search:

- Enter departure airport, arrival destination, date of journey, and cabin class.
- Retrieve and display real-time flight lists with fares, timings, and available seats.

 Seat Selection & Booking:

- Choose seats from the interactive aircraft cabin layout.
- Fill out passenger manifest information and proceed to the integrated checkout gateway.

 Ticket Issuance & Itinerary Management:

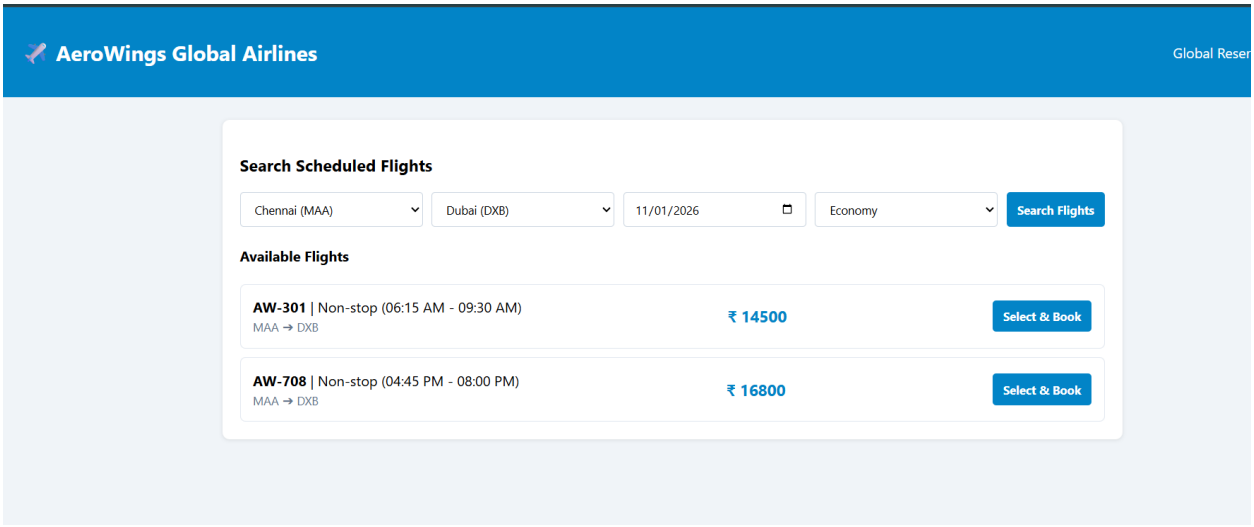

- Generate an e-ticket with booking reference and send an email confirmation.
- Provide options to view itinerary, print e-tickets, or initiate booking cancellation.

 Admin Operations & Feedback:

- Manage flight master data, adjust seat inventories, and review system flight reports.
- Collect and store passenger reviews through the customer feedback module.

 Stop.
